Chapter 1

Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

[Graph.Graph](#)

XyGraph constructing class

Author: Hatim Rehman

This class represents a graph object that can plot points with data contained within a list of tuples

[(x1, y1), (x2, y2), ... , (xn, yn)] [3](#)

Chapter 2

Class Documentation

2.1 Graph.Graph Class Reference

xyGraph constructing class

Author: Hatim Rehman

This class represents a graph object that can plot points with data contained within a list of tuples

[(x1, y1), (x2, y2), ... , (xn, yn)]

Public Member Functions

- `def __init__ (self, n, data=None)`
The constructor method Takes in 3 parameters.
- `def plot_point (self, coord, kwargs)`
Plot points method Takes in a coordinate to plot, with keyword args that may be used to style the coordinate.
- `def plot_points (self, data=None, kwargs)`
Plot points method takes in multiple coordinates and calls the `plot_point()` method from its own API on each method.
- `def plot_points_with_line (self, data, kwargs)`
Plot points with line method takes in multiple coordinates and calls the `plot_point()` method from its own API on each method.
- `def plot_function (self, func, x_interval=None, kwargs)`
Plots a python function onto the graph Outputs a graph with the func parameter plotted.

Public Attributes

- **data**
- **markings**
- **scale**
- **scale_x**
- **scale_y**
- **master**
- **graph**
- **graph_height**
- **graph_width**
- **x_offset**
- **y_offset**
- **dx**
- **dy**

2.1.1 Detailed Description

xyGraph constructing class

Author: Hatim Rehman

This class represents a graph object that can plot points with data contained within a list of tuples

[(x1, y1), (x2, y2), ... , (xn, yn)]

2.1.2 Constructor & Destructor Documentation

2.1.2.1 __init__()

```
def Graph.Graph.__init__ (
    self,
    n,
    data = None )
```

The constructor method Takes in 3 parameters.

Outputs a graph with plotted data that is entered as a parameter.

Parameters

<i>self</i>	The object pointer.
<i>n</i>	The number of markings to appear on the x and y axes
<i>data</i>	The data to plot

2.1.3 Member Function Documentation

2.1.3.1 plot_function()

```
def Graph.Graph.plot_function (
    self,
    func,
    x_interval = None,
    kwargs )
```

Plots a python function onto the graph Outputs a graph with the func parameter plotted.

Parameters

<i>self</i>	The object pointer.
<i>func</i>	A python function that takes in a double value and returns a double value
<i>x_interval</i>	A list of double values that the function should pass through [x1, ... , xn]
<i>kwargs</i>	Keyword arguments for Tkinter's create_circle() method

2.1.3.2 plot_point()

```
def Graph.Graph.plot_point (
    self,
    coord,
    kwargs )
```

Plot points method Takes in a coordinate to plot, with keyword args that may be used to style the coordinate.

First translates the coordinate from the cartesian system to the Canvas object coordinate system, then calls Tkinter's `create_circle` method on the Window object. Outputs a graph with the `coord` parameter plotted.

Parameters

<i>self</i>	The object pointer.
<i>coord</i>	A dictionary with the format { 'x': <i>value</i> , 'y': <i>value</i> }
<i>kwargs</i>	Keyword arguments for Tkinter's <code>create_circle()</code> method

2.1.3.3 plot_points()

```
def Graph.Graph.plot_points (
    self,
    data = None,
    kwargs )
```

Plot points method takes in multiple coordinates and calls the [plot_point\(\)](#) method from its own API on each method.

Outputs a graph with the `data` parameter plotted.

Parameters

<i>self</i>	The object pointer.
<i>data</i>	A list of tuples [(x1, y1), (x2, y2), ... , (xn, yn)]
<i>kwargs</i>	Keyword arguments for Tkinter's <code>create_circle()</code> method

2.1.3.4 plot_points_with_line()

```
def Graph.Graph.plot_points_with_line (
    self,
    data,
    kwargs )
```

Plot points with line method takes in multiple coordinates and calls the [plot_point\(\)](#) method from its own API on each method.

Then calls its private function generating method that creates a polynomial that passes through each point using the Lagrange polynomial interpolation theorem. Outputs a graph with the data parameter plotted.

Parameters

<i>self</i>	The object pointer.
<i>data</i>	A list of tuples [(x1, y1), (x2, y2), ... , (xn, yn)]
<i>kwargs</i>	Keyword arguments for Tkinter's create_circle() method

The documentation for this class was generated from the following file:

- Graph.py
